Set Time Out And Set Interval
description Set Time out
The setTimeout() method calls a function or evaluates an expression after a specified number of milliseconds.
description
The setInterval() method calls a function or evaluates an expression at specified intervals (in milliseconds).

The setInterval() method will continue calling the function until clearInterval() is called, or the window is closed.

Getting Started

We create an HTML 5 with two js scripts to reference timeout and set interval

Prerequisites
We need only visual studio code
Running the tests

/Set time out performs a callback function by passing 5 seconds and showing the alert
function setTime()
   setTimeout(function() { alert("Esto es SetTimeOut"); }, 5000);
}

// The setInterval() method calls a
// function or evaluates an expression at specified intervals(in milliseconds).
// The setInterval() method will continue calling the function until clearInterval() is called, or the window is closed.
function setInter() {
setInterval(function() s alert("This is SetInterval"); .
}
